Value Gap Emerges: ARL expenditures vs. perceptions of library value as gateway

- Tenopir, "Investment in the Library: What's the Return?" Madrid, April 2007

- “During the recession there was a reduction in cost for most commodities and goods—with the Consumer Price Index (CPI) dropping in 2009 and only increasing 1.6 percent in 2010. During that same period, serials prices continued to rise at well above the CPI (four to five percent),

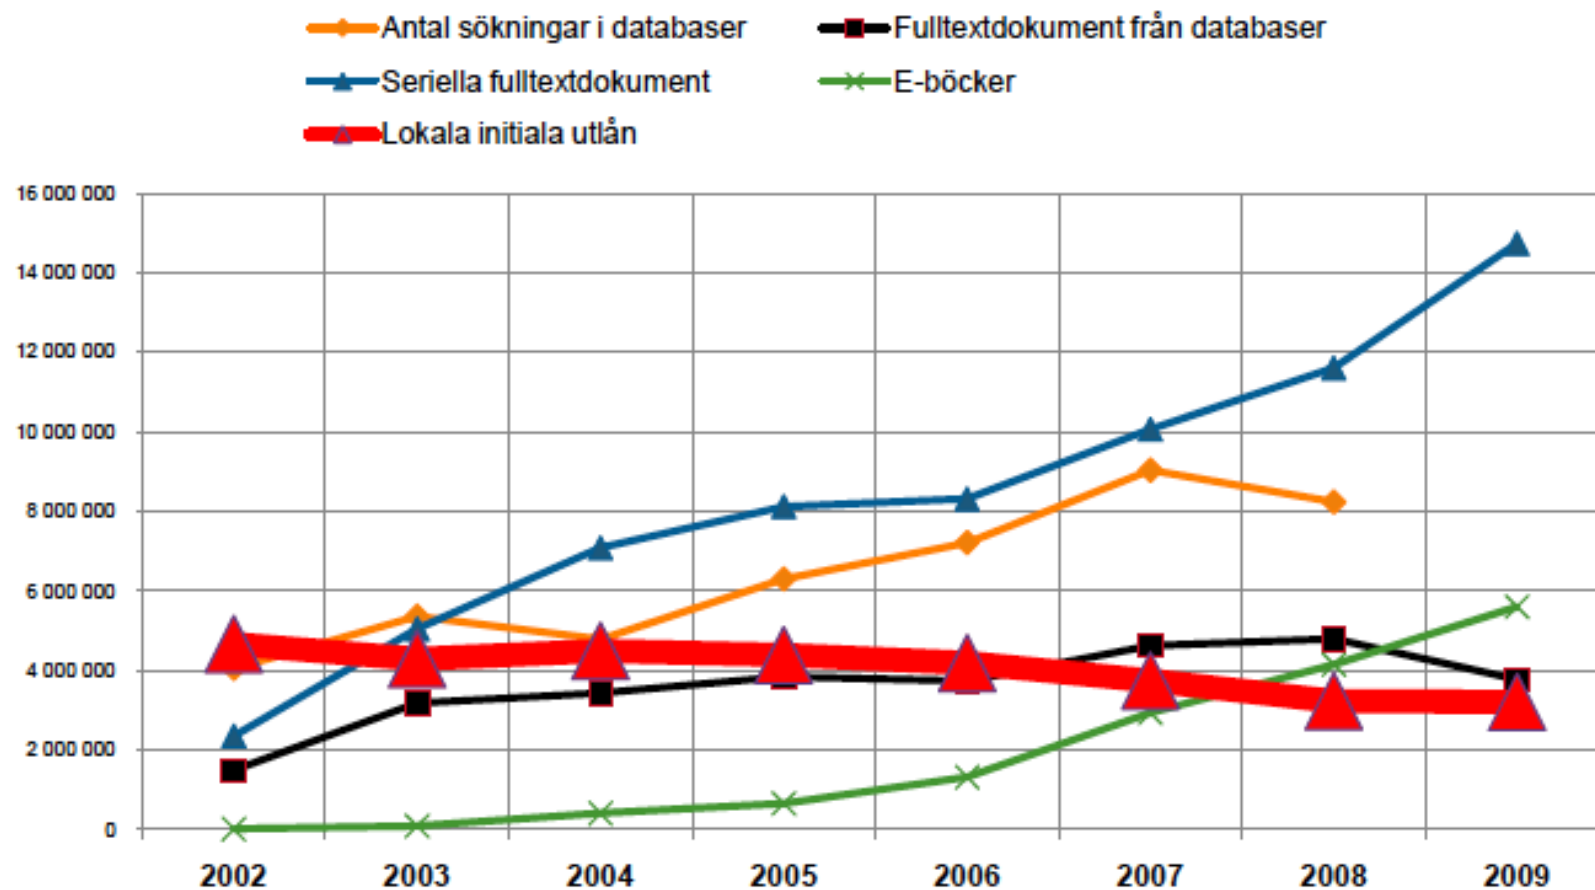

TABLE 1 AVERAGE 2011 PRICE FOR SCIENTIFIC DISCIPLINES

DISCIPLINE	AVERAGE PRICE PER TITLE	DISCIPLINE	AVERAGE PRICE PER TITLE
Chemistry	\$4,044	Math & Computer Science	\$1,593
Physics	3,499	Food Science	1,564
Biology	2,167	Health Sciences	1,470
Engineering	2,035	Technology	1,374
Astronomy	2,008	General Science	1,333
Geology	1,791	Geography	1,155
Botany	1,731	Agriculture	1,103
Zoology	1,647

I mostly use e-journals

Who use a library in 2010? Everything should be on the internet.

I mainly use the e-journal/e-book resources, which i find excellent. However, the search functions are not great, so I usually locate articles using google and use the library proxy to access them.

The digital library is extremely useful

Make a search engine where I can search for keywords in all the databases/e-journals available instead of having to go through every database/journal with one search word

To be able to search the database! ... Which searches all the good databases that you have on your site. But on the same time! ... It is also good when you cant specify which area your "thing" is located in.

An improved search engine on the papers we have access to through chalmers library

Because we are doing projects and the most quick and effective way is to get information is to search on the internet.

Help you to know more about different databases. Difficult to know which ones to u

Easier access to published technical reports (I found them very hard to find through the library web page and eventually turned to google instead).

“Only librarians like to search;
everyone else likes to find.”

- Roy Tennant -

- Serials Solutions has the best federated search product on the market

Federated Search Mode

Results

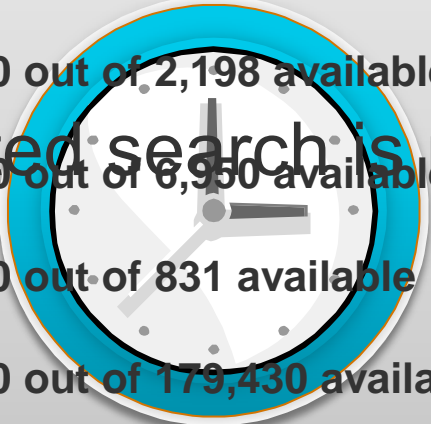

DB1= 20 out of 2,198 available

DB2= 30 out of 6,950 available

DB3= 20 out of 831 available

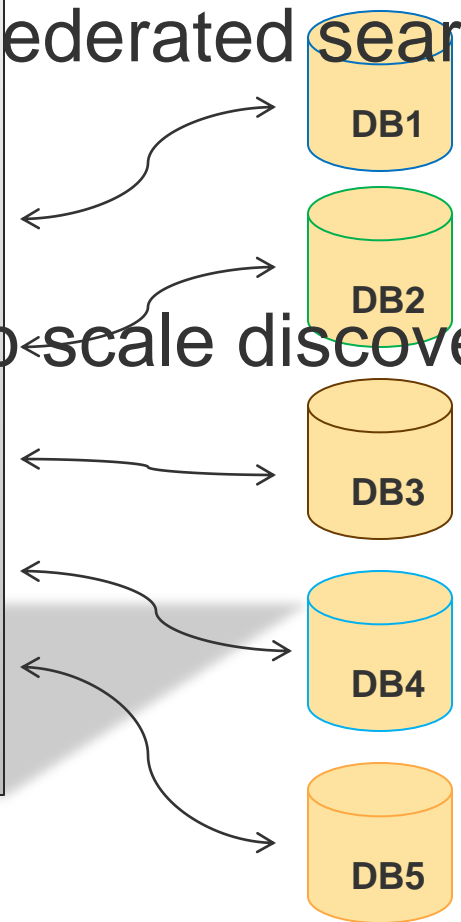

DB4= 10 out of 179,430 available

DB5= 0 results (broken connector)

...but federated search is not web-scale discovery

Databases

- Limited Results Set

- One stop shop for the library's resources
- Search everything with one click
- Simple. Easy. Fast
- Find relevant results regardless of content provider
- No need to sift through unfamiliar database names

- Built from scratch and built to purpose
 - Architected like Google and other Open Web solution
 - Built to handle large data and deliver results fast
 - Pre-Harvested content in a single unified index
 - Strong agile integrated API
 - Moves libraries beyond federated search

Growing list of Summon libraries

- Well over 240 libraries, in 30 countries
- **70 Libraries** in Europe, Middle East and Africa
- Some of the **Largest and Prestigious** Institutions in the World
- **Proven SaaS** Architecture

progress

Microbial genome sequencing

Claire M. Fraser¹, Jonathan A. Eisen¹ & Steven L. Salzberg¹

The application of genomic technology to the microbial field. It was only five years ago that The Institute for Genomic Research (TIGR) published the first complete genome sequence for a free-living organism, *Haemophilus influenzae*²; since that first report another 27 microbial genome sequences have been published, with at least 10–20 other projects at or near completion (for details see <http://www.tigr.org/tdb/mdb/mdb.html>). This progress represents, on average, one completed genome sequence every two months and all indications are that this pace will continue to accelerate. Included in the first completed microbial projects are many important human pathogens, the simplest known free-living organism, 'model' organisms, *Escherichia coli* and *Bacillus subtilis*, thermophilic bacterial species that might represent some of the deepest-branching members of the bacterial lineage, five representatives of the archaeal domain, and the first eukaryote, *Saccharomyces cerevisiae*. All of the organisms that have been studied by whole-genome analysis are species that can be grown either in the laboratory or in animal cells. It is important to remember that the vast majority of microbial species cannot be cultivated at all, and these organisms, which live in microbial communities, are essential to the overall ecology of the planet. Nevertheless, the study of 'laboratory-adapted' microbes has had a profound impact on our understanding of the biology and the evolutionary relationships between microbial species.

Escherichia coli and Bacillus subtilis, thermophilic bacterial species that might represent some of the deepest-branching members of the bacterial lineage, five representatives of the archaeal domain, and the first eukaryote, Saccharomyces cerevisiae

I have really found SUMMON useful for helping me look for journal article's and books that i could not find on OPAC.

My 1st point of call now is SUMMON.

very nice, saves time, simple and fun to use.

I LOVE this!!!! This is so much easier than wading through databases to find an article. This is wonderful! Can we keep it? Can we keep it? :-)
